

My TO-DO App

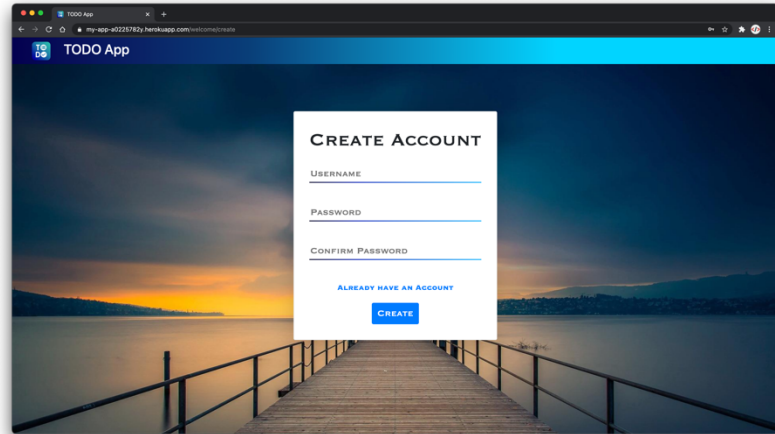

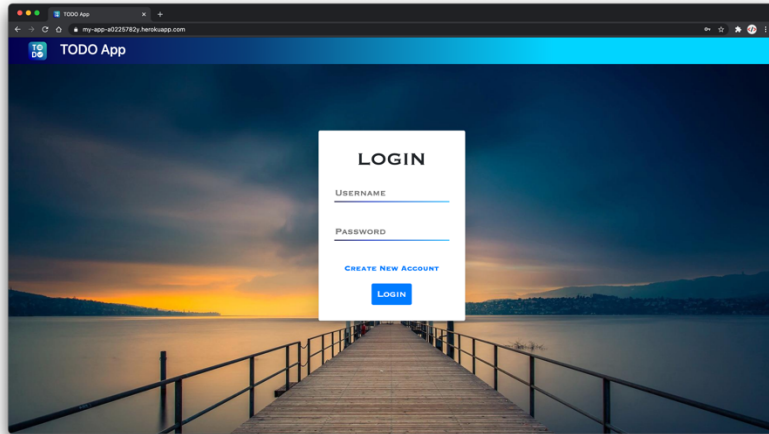

This website helps you manage your tasks easily, with an easy to use but elegant interface designed using Rails and a backend implemented using Rails. A working version is hosted at <https://my-app-a0225782y.herokuapp.com/>.

My Accomplishments

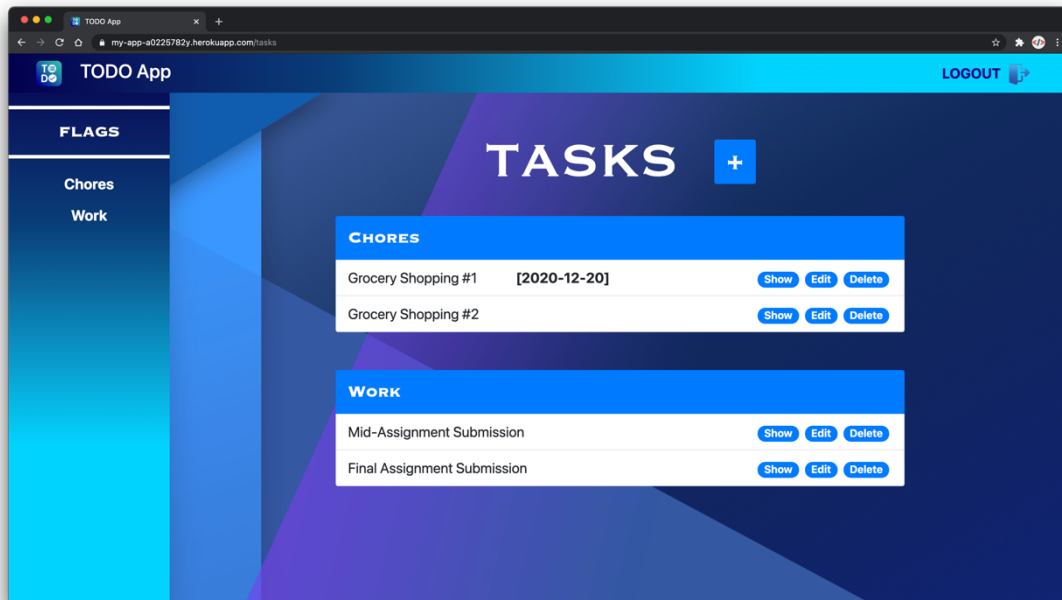

Having completed this assignment to my satisfaction, I believe that I have gained a thorough understanding of Rails and React and also brushed up on my HTML, CSS and JavaScript. There were several issues along the way while trying to build the website, all of which I have resolved on my own and as a result bettered my grasp of the languages. I have completed this project perfectly with all CRUD functionality implemented as well as some aesthetic implementations.

User Manual

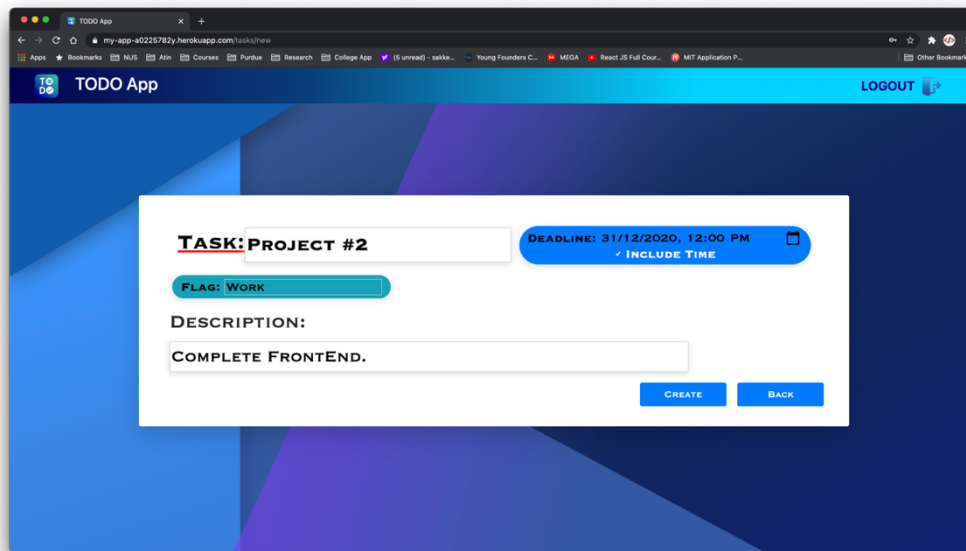

On entry you are greeted by a welcome screen which scrolls down to reveal a login form. You can then choose to login with an existing or create a new account by going to the registration page.

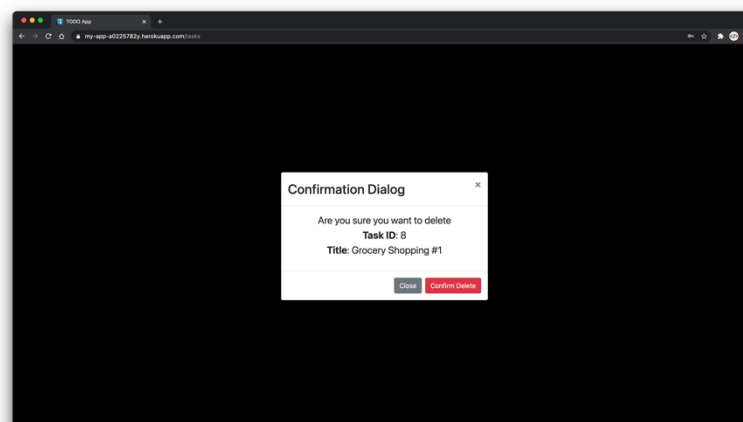

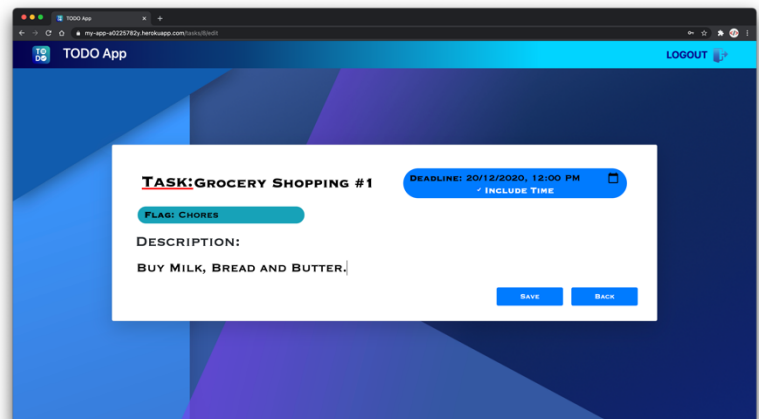

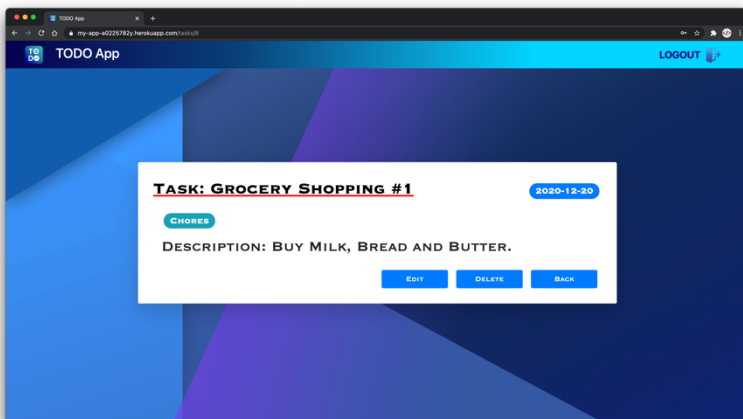

Once logged in you are redirected to the index page where all tasks are shown grouped by flags and ordered by their deadlines. You can view the deadline by hovering over the task title and you can directly navigate to a flag by clicking on the appropriate flag shown on the sidebar.

Click the “+” sign beside the title to add a new task. You will be taken to another page where you can enter all the necessary info, description and time are optional. The title must be unique with minimum 5 characters and a maximum of 60 characters. The flag should have a minimum of 2 characters and the description if present should have minimum of 10 characters.

In the index page, each task has three options: Show, Edit, and Delete. The former two options will take you to their respective pages while the Delete option will open up a confirmation dialog. The Edit and Delete options are also accessible through the Show page.

-----THANK YOU-----
